In this section we solve linear first order differential equations, i.e. differential equations in the form  $y' + p(t)y = g(t)$ . We give an in depth overview of the process used to solve this type of differential equation as well as a derivation of the formula needed for the integrating factor used in the solution process.

Here  $x$  is the decision variable and  $c$ ,  $d$ , and  $s$  are parameters. The difference between a parameter and a decision variable is an important one. A parameter is a constant during the solution of the model: it will not be changed by
