Fluoride Therapy - Pediatric Dentistry

Article by Jan Sallstrom, Ph D in zoophysiology, about fluoride which is not only a cell poison that could cause neurological symptoms but also damages the teeth. The effect on caries is debated, while it actually causes another dental disease, fluorosis.

Fluoride in dentistry is a cell poison - Art Bin

Fluoride varnish is a highly concentrated form of fluoride which is applied to the tooth's surface, by a dentist, dental hygienist or other health care professional, as a type of topical fluoride therapy. It is not a permanent varnish but due to its adherent nature it is able to stay in contact with the tooth surface for several hours.

Fluoride varnish - Wikipedia

August, 2007 4 dental caries of 18% to 25% were demonstrated when preventive care was initiated before caries was observed. Infants, toddlers and preschool children who were caries free at baseline benefited most from

Fluoride Varnish: an Evidence-Based Approach Research

Background. With the dramatic increase in the amount of scientific information available about oral health, an evidence-based approach to oral health care and the practice of dentistry is necessary.

Professionally applied topical fluoride

Water fluoridation is the controlled addition of fluoride to a public water supply to reduce tooth decay. Fluoridated water contains fluoride at a level that is effective for preventing cavities; this can occur naturally or by adding fluoride. Fluoridated water operates on tooth surfaces: in the mouth, it creates low levels of fluoride in saliva, which reduces the rate at which tooth enamel ...

Water fluoridation - Wikipedia

Tooth decay (cavities) is one of the most common chronic conditions of childhood in the United States. Untreated tooth decay can cause pain and infections that may lead to problems with eating, speaking, playing, and learning. Applying dental sealants to the chewing surfaces of the back teeth is ...
